PURPOSE: To prevent hydrogen from diffusing in a semiconductor substrate and to improve the reliability of a device by a method wherein the device is provided with a layer which absorbs the hydrogen existing in insulating films.

CONSTITUTION: A composite film 8 consisting of a metal layer 82, which consists of a metal which absorbs hydrogen to make a hydride, and insulating layers (silicon nitride layers) 81 and 83 is provided on a semiconductor substrate 1 with an element formed on it. A nitrogen-containing insulating layer, such as a silicon nitride layer, contains much hydrogen, where there is the metal layer, which absorbs hydrogen to make a hydride, the hydrogen is absorbed in this metal film. For example, as a metal layer to absorb hydrogen well, a palladium (Pd) layer is formed. Thereby, as hydrogen existing in a surface protective film and an interlayer insulating film can be captured by the metal layer, the diffusion of the hydrogen in a substrate is suppressed and the generation of hot electrons in the substrate can be deterred.

42: insulating film, 63: upper layer drain wiring, 7: interlayer insulating film, 62: drain wiring, 41: insulating film, 5: gate oxide film, 32: gate electrode, 61: drain region, 51: gate oxide film, 53: source region, 5: source wiring
